

Echo Verify – site commissioning tool

Advanced mobile network measurement solution

Echo Verify is a part of the Enhancell Echo product family which consists of network measuring tools that run directly on commercial handsets.

With Echo you do not need custom test devices and firmware. This means that you can be assured of seeing the network exactly as your customers see it.

Echo Verify

Echo Verify is a site-commissioning tool for confirming that a cell tower is RFC (ready for customer), and for ensuring that cells are operating according to planned parameters. Echo Verify has multi-technology capabilities, supporting 2G/3G/4G/5G (NSA/SA) and voice call test routing (including emergency calls to 112/911 depending on your location.) Data testing, e.g., speed test and PING is effortless with Echo Verify. Also, handover tests between neighbor sectors (walk tests) can be performed with ease.

Echo Verify performs relevant parameter checks for the selected test technologies. Cross feeder and sector indication are both enabled. Echo Verify dashboard can manage large test scenarios (> 10.000 sites) and small-scale testing requirements. This makes it the perfect tool for both subcontractors and multinational network operators as well as tower companies.

Echo Verify Cloud dashboard

Echo Verify Cloud dashboard provides configuration, allocation of sites to be tested, and result reporting remotely in real-time. The dashboard can be shared between multiple different user levels. Echo Verify Cloud dashboard enables cell file handling including customizable test cases per technology and band.

In addition, Echo Verify Cloud has operator-specific reporting and documentation possibilities to make creating reports simple and to create reports which cannot be falsified.

Handheld app

Echo Verify handheld software application can be installed on any commercial rooted phone provided by customer or Enhancell Ltd. As Echo Verify is based on commercial phones it is possible to apply your own concept which fits your needs. The Echo product family supports more than 180 phones, always keeping up with the new models published on the market to ensure the support of the latest 3GPP standard implementations.

A built-in navigation tool helps the user to navigate to where the base station is located.

Flexible licensing

Echo Verify is an affordable solution with flexible licensing to meet your budgeting needs. The costs are based on the capacity of the site or the project in question. In addition, Enhancell's floating license concept enables sharing licenses between field technician teams. The customer can choose from a per day or a per year license purchase, whichever suits their project best.
